

## Supplementary material.

**Figure S1. Macroscopic and microscopic observations of coagglutination between *Saccharomyces cerevisiae* and bacterial strains.** a) Macroscopic evidence of coagglutination between *S. cerevisiae* and Enterotoxigenic *Escherichia coli*. b) Absence of coagglutination between *S. cerevisiae* and *Pseudomonas aeruginosa*. c) Microscopic confirmation of coagglutination observed in a), with arrows indicating clusters of *S. cerevisiae* and ETEC. d) Microscopic observation of the lack of co-agglutination in b), showing no interaction between *S. cerevisiae* and *P. aeruginosa*.
