Abstract (en)

[origin: EP0702115A1] To one flat side of the core (1) of the plaster structural plate connects a glass fleece layer (2), which outwardly is provided with a calcium sulphate coating (3). The glass fleece layer is divided into two coat-type areas (4,5), whereby the one area (4) is filled with a coating mass, which also forms the calcium sulphate coating. The other area (5) is filled with a core mass, which also forms the plate core. The coating masses are in contact with one another in the glass fleece layer along a dividing surface (6). The commencement of stiffening of the coating mess amounts to at least 1.5 hours and at most 6 hours. The plate has an average lift-off strength of at least 0.20 N/mm<2>. The calcium sulphate is a calcium sulphate anhydrite.
